

**Amendments to the Claims:**

This listing of claims will replace all prior versions and listings of claims in the application:

**Listing of Claims:**

1 (currently amended): An interface apparatus comprising:

- 5       a base;  
      a receiving circuit for receiving a video signal;  
      a display panel for transforming the video signal into an image and  
          displaying the image thereon;  
      a shaft connected to the display panel and movably disposed on the base;  
10       and  
      a detecting module for detecting a movement of the shaft relative to  
          the base and generating a detecting signal correspondingly;  
      wherein when the shaft is moved, the shaft simultaneously moves the  
          display panel, and the detecting module generates the detecting  
15       signal, and when the interface apparatus is rotated in a plane parallel with a  
          plane of the display apparatus, the images displayed on the display panel move  
          corresponding to the rotation of the interface apparatus.

- 2 (original): The interface apparatus of claim 1 wherein the shaft further comprises at  
20       least one handle connected to the display panel for a user to move the shaft.

- 3 (original): The interface apparatus of claim 2 wherein the shaft further  
      comprises:  
      at least one button disposed on the handle for the user to press; and  
25       a button circuit outputting a corresponding button signal while the  
          button is pressed.

4 (original): The interface apparatus of claim 1 wherein the display panel is a liquid crystal display.

5 (currently amended): A computer system comprising:

5 a mainframe providing a video signal; and  
an interface apparatus electrically connected to the mainframe, the  
interface apparatus comprising:  
a base;  
a receiving circuit for receiving the video signal;  
10 a display panel for transforming the video signal into an image and  
displaying the image;  
a shaft connected to the display panel and movably disposed on the  
base; and  
a detecting module for detecting a movement of the shaft relative to  
15 the base and outputting a detecting signal;  
wherein when the shaft is moved, the shaft simultaneously moves the  
display panel, and the detecting module outputs the detecting  
signal to the mainframe, and when the interface apparatus is rotated in a  
plane parallel with a plane of the display apparatus, the images displayed on the  
20 display panel move corresponding to the rotation of the interface apparatus.

6 (original): The computer system of claim 5 wherein the shaft further comprises at least one handle connected to the display panel for a user to move the shaft.

25 7 (original): The computer system of claim 6 wherein the shaft further  
comprises:  
at least one button located on the handle for the user to press; and  
a button circuit outputting a corresponding button signal while the

button is pressed, and the mainframe receiving the button signal  
and performing a relative operation.

8 (original): The computer system of claim 5 wherein the display panel is a  
5 liquid crystal display.
